The ability of small spacecraft to work in coordination with other satellites to explore asteroids, planets and moons, is a topic of growing interest. The Small Spacecraft Technology Initiative (SSTI) is a program by NASA designed to develop smaller, more versatile spacecraft technologies for space exploration. SSTI aims to enhance the capabilities and technologies associated with small spacecraft, making them more cost-effective and capable of performing missions beyond Earth's orbit.

The Small Spacecraft Technology Program at NASA is structured to advance the capabilities and technologies associated with small spacecraft. This program supports the development of small spacecraft technology initiatives, some of which weigh only a few pounds, that dramatically enhance their ability to meet mission requirements at lower cost. Special attention is focused on the role that technology plays in small spacecraft missions. The program's goals include developing technologies for small spacecraft that can enhance science, exploration, operations, and technology organizations are identifying a growing number of potential applications for very small spacecraft. This book reviews the U.S. National Aeronautics and Space Administration's NASA small spacecraft technology development. Included are assessments of technology for small spacecraft - Panel on Small - Google Books.

The Small Satellite Technology Initiative (SSTI) is a National Aeronautics and Space Administration (NASA) program to demonstrate smaller spacecraft technology. SSTI is aimed at developing and demonstrating small spacecraft technology through projects, such as the Clark spacecraft, which was developed by a team from MIT, Draper, and NASA. This spacecraft is designed to be lightweight and capable of performing complex missions.

NASA has published a detailed report on the state of small spacecraft development and operations. The report, “Small Spacecraft Technology: Small spacecraft are better right? - First Smallsat Technology Partnerships,” examines the small spacecraft technology programs of other government agencies and assesses technology efforts in industry. Small Spacecraft Technology (SST) is a technology development initiative that provides spacecraft power system integrators a low cost alternative to a custom design electric power system. The thrusters, which can run on solar power, contain a small amount of liquid.

People have very big plans for these very small spacecraft. New jetpack technology being developed by a team from MIT, Draper, and NASA. Building the Small Spacecraft Technology Pipeline at NASA, the small spacecraft technology initiative "Clark" spacecraft 28 Jun 1999. The Small Satellite Technology Initiative (SSTI) is a National Aeronautics and Space Administration (NASA) program to demonstrate smaller spacecraft technology. SSTI is aimed at developing and demonstrating small spacecraft technology through projects, such as the Clark spacecraft, which was developed by a team from MIT, Draper, and NASA. This spacecraft is designed to be lightweight and capable of performing complex missions.

The Small Satellite Technology Initiative (SSTI) is an initiative of NASA's Small Spacecraft Technology Program. SSTI seeks to develop and demonstrate smaller spacecraft technologies that can enhance space science, exploration, and human spaceflight. The program's goals include developing technologies for small spacecraft that can enhance science, exploration, operations, and technology organizations are identifying a growing number of potential applications for very small spacecraft. This book reviews the U.S. National Aeronautics and Space Administration's NASA small spacecraft technology development.
